

Topic II -

Review of power series

- power series

- thm 37.24

- radii of convergence

- e^x

- $x^2 + 1$

- $\frac{1}{1-x}$

- do e^{x^2}

Approximate

$\frac{1}{1-x}$ by successive terms

HW

- add up first few terms of power series to approximate

- analytic

- Taylor series

$$f(x) = f(x_0) + f'(x_0)(x-x_0) + \dots$$

- ex: Suppose you know $f(0) = 2, f'(0) = 1, f''(0) = 5, \dots$ find first few terms of power series

term by term

- derivatives then

$$f(x) = \sum_{n=0}^{\infty} a_n (x-x_0)^n = \dots$$

$$f'(x) = \sum_{n=1}^{\infty} a_n \cdot n \cdot (x-x_0)^{n-1} = \dots$$

$$f''(x) = \sum_{n=2}^{\infty} a_n \cdot n \cdot (n-1) \cdot (x-x_0)^{n-2} = \dots$$

Talk about index

Def: An infinite sum is a sum of the form

$$\sum_{n=0}^{\infty} a_n = a_0 + a_1 + a_2 + a_3 + a_4 + \dots$$

where the a_i are real numbers.

We say that the sum above converges if there exists a real number S where

$$\lim_{N \rightarrow \infty} \underbrace{\sum_{n=0}^N a_n}_{\text{Summing the first } N \text{ terms}} = \lim_{N \rightarrow \infty} \underbrace{(a_0 + a_1 + a_2 + \dots + a_N)}_{\text{these are called partial sums}} = S$$

In this case we write

$$\sum_{n=0}^{\infty} a_n = S$$

If the above limit doesn't exist then we say that the infinite sum diverges.

Def: A power series is an infinite sum of the form

$$\sum_{n=0}^{\infty} a_n (x-x_0)^n = a_0 + a_1 (x-x_0) + a_2 (x-x_0)^2 + a_3 (x-x_0)^3 + \dots$$

Above x is a variable and the a_n and x_0 are constants. The power series is said to be centered at x_0 .

Ex: (Geometric series)

$$\sum_{n=0}^{\infty} x^n = 1 + x + x^2 + x^3 + x^4 + \dots$$

$\sum_{n=0}^{\infty} a_n (x-x_0)^n$

$a_n = 1$ for all n

$x_0 = 0$

This power series is centered at $x_0 = 0$

In Calculus you showed that

↙

Case 1: If $-1 < x < 1$, then the geometric sum converges and

$$\sum_{n=0}^{\infty} x^n = 1 + x + x^2 + x^3 + \dots = \frac{1}{1-x}$$

Case 2: If $-1 < x$ or $1 < x$, then the geometric sum

$$\sum_{n=0}^{\infty} x^n = 1 + x + x^2 + x^3 + \dots$$

diverges (it doesn't have a limit)

Ex: $\sum_{n=0}^{\infty} \left(\frac{1}{2}\right)^n = 1 + \frac{1}{2} + \frac{1}{2^2} + \frac{1}{2^3} + \dots$

$\frac{1}{1 - \frac{1}{2}} = \frac{1}{\left(\frac{1}{2}\right)} = 2$

$x = \frac{1}{2}$
 $-1 < x < 1$

Ex:

$$\sum_{n=0}^{\infty} 5^n = 1 + 5 + 5^2 + 5^3 + \dots$$

diverges

Idea:

Think of $\sum_{n=0}^{\infty} x^n$ as a function $f(x)$.

$$\text{So, } f(x) = \sum_{n=0}^{\infty} x^n = 1 + x + x^2 + x^3 + x^4 + \dots$$

this equals $\frac{1}{1-x}$ when $-1 < x < 1$

Then

$$f(0) = 1 + 0 + 0^2 + 0^3 + \dots = \frac{1}{1-0} = 1$$

$$f\left(\frac{1}{3}\right) = 1 + \frac{1}{3} + \frac{1}{3^2} + \frac{1}{3^3} + \dots = \frac{1}{1-\frac{1}{3}} = \frac{3}{2}$$

$$f\left(-\frac{1}{4}\right) = 1 + \left(-\frac{1}{4}\right) + \left(-\frac{1}{4}\right)^2 + \left(-\frac{1}{4}\right)^3 + \dots$$

$$= 1 - \frac{1}{4} + \frac{1}{4^2} - \frac{1}{4^3} + \dots$$

$$= \frac{1}{1 - \left(-\frac{1}{4}\right)} = \frac{4}{5}$$

$$f(0) = 1$$

$$f\left(\frac{1}{3}\right) = \frac{3}{2}$$

$$f\left(-\frac{1}{4}\right) = \frac{4}{5}$$

However,

$$f(2) = 1 + 2 + 2^2 + 2^3 + \dots$$

$$f(-3.2) = 1 - 3.2 + (-3.2)^2 + (-3.2)^3 + \dots$$

are undefined.

Picture:

f is only defined in this interval

← you can only plug in x 's in this range into the power series.
 $r=1$ is called the radius of convergence

Theorem: There are three possible scenarios for a power series

$$\sum_{n=0}^{\infty} a_n(x-x_0)^n = a_0 + a_1(x-x_0) + a_2(x-x_0)^2 + \dots$$

① The series converges only when $x = x_0$.

Here you can only plug $x = x_0$ into the series. In this case we say the radius of convergence is $r = 0$

② There exists $r > 0$ where the series converges for all x when $x_0 - r < x < x_0 + r$, but it doesn't converge if $x < x_0 - r$ or $x_0 + r < x$. r is called the radius of convergence.

In this case as long as x is in this interval the series converges. Past the endpoints it will diverge. At endpoints can either converge or diverge.

③ The series converges for all x .

Here $r = \infty$ is the radius of convergence.

The next examples are from Calculus.

Ex:

$$e^x = \sum_{n=0}^{\infty} \frac{1}{n!} x^n = 1 + x + \frac{1}{2!} x^2 + \frac{1}{3!} x^3 + \dots$$

converges for all x .

Here $x_0 = 0$, $r = \infty$

Ex: The sine/cosine series centered at $x_0 = 0$ are:

$$\begin{aligned} \sin(x) &= \sum_{n=0}^{\infty} (-1)^n \frac{1}{(2n+1)!} x^{2n+1} \\ &= x - \frac{1}{3!} x^3 + \frac{1}{5!} x^5 - \frac{1}{7!} x^7 + \dots \end{aligned}$$

$$\begin{aligned} \cos(x) &= \sum_{n=0}^{\infty} (-1)^n \frac{1}{(2n)!} x^{2n} \\ &= 1 - \frac{1}{2!} x^2 + \frac{1}{4!} x^4 - \frac{1}{6!} x^6 + \dots \end{aligned}$$

These both converge for all x

So, $r = \infty$.

Ex: If $-1 \leq x \leq 1$, then

$$\tan^{-1}(x) = \sum_{n=0}^{\infty} (-1)^n \frac{1}{(2n+1)!} x^{2n+1}$$

$$= x - \frac{1}{3!} x^3 + \frac{1}{5!} x^5 - \frac{1}{7!} x^7 + \dots$$

Sum
is
only
defined
when
 $-1 \leq x \leq 1$

radius
of
convergence
is
 $r = 1$
centered
at $x_0 = 0$

Ex: We can make a power series centered at $x_0 = 1$ that converges to $\ln(x)$. It is,

$$\ln(x) = \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n} (x-1)^n$$

$$= (x-1) - \frac{1}{2}(x-1)^2 + \frac{1}{3}(x-1)^3 - \dots$$

It converges on when $0 < x < 2$.

from calculus

graph of $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n} (x-1)^n$

Here we have:

So,
 $x_0 = 1$
 $r = 1$

radius of convergence

Theorem: Suppose

$$f(x) = \sum_{n=0}^{\infty} a_n (x-x_0)^n = a_0 + a_1 (x-x_0) + a_2 (x-x_0)^2 + a_3 (x-x_0)^3 + \dots$$

has radius of convergence $r > 0$.

Then,

$$a_n = \frac{f^{(n)}(x_0)}{n!}$$

Ex:

$$\sin(x) = x - \frac{1}{3!} x^3 + \frac{1}{5!} x^5 - \frac{1}{7!} x^7 + \dots$$

$x_0 = 0$

$$= 0 + 1 \cdot x + 0 \cdot x^2 - \frac{1}{3!} x^3 + 0 \cdot x^4 - \frac{1}{5!} x^5 + \dots$$

$f(x) = \sin(x)$
 $f(0) = 0$

$f'(x) = \cos(x)$
 $f'(0) = 1$
 $\frac{f'(0)}{1!} = 1$

$f''(x) = -\sin(x)$
 $f''(0) = 0$
 $\frac{f''(0)}{2!} = 0$

$f^{(3)}(x) = -\cos(x)$
 $f^{(3)}(0) = -1$
 $\frac{f^{(3)}(0)}{3!} = -\frac{1}{3!}$

Ex: Find a power series for $f(x) = x^2$
centered at $x_0 = 2$.

Let's use the formula above to hopefully
get an answer.

$$f(x) = x^2 \rightarrow f(2) = 4$$

$$f'(x) = 2x \rightarrow f'(2) = 4$$

$$f''(x) = 2 \rightarrow f''(2) = 2$$

$$f^{(3)}(x) = 0 \rightarrow f^{(3)}(2) = 0$$

$$f^{(k)}(x) = 0 \rightarrow f^{(k)}(2) = 0$$

$k \geq 4$ $k \geq 4$

$$f(2) + f'(2)(x-2) + \frac{f''(2)}{2!}(x-2)^2 + \frac{f^{(3)}(2)}{3!}(x-2)^3$$
$$+ \frac{f^{(4)}(2)}{4!}(x-2)^4 + \dots$$

$$= 4 + 4(x-2) + \frac{2}{2}(x-2)^2 + 0(x-2)^3 + 0(x-2)^4 + \dots$$

$$= 4 + 4(x-2) + (x-2)^2$$

One can check: $x^2 = 4 + 4(x-2) + (x-2)^2$

And the right-hand side always converges since it's a finite sum.

The radius of convergence is $r = \infty$,
ie the formula works for all x .

Theorem: If

$$f(x) = \sum_{n=0}^{\infty} a_n (x-x_0)^n = a_0 + a_1(x-x_0) + a_2(x-x_0)^2 + \dots$$

has radius of convergence $r > 0$, then

$$\begin{aligned} f'(x) &= \sum_{n=1}^{\infty} n \cdot a_n (x-x_0)^{n-1} \\ &= a_1 + 2a_2(x-x_0) + 3a_3(x-x_0)^2 + \dots \end{aligned}$$

and

$$\begin{aligned} \int f(x) dx &= \sum_{n=0}^{\infty} \frac{a_n}{n+1} (x-x_0)^{n+1} \\ &= a_0(x-x_0) + \frac{a_1}{2}(x-x_0)^2 + \frac{a_2}{3}(x-x_0)^3 \\ &\quad + \dots \end{aligned}$$

where the power series for $f'(x)$
and $\int f(x) dx$ also have
radii of convergence r .

Ex: Find a power series expansion for $f(x) = \frac{1}{x}$ at $x_0 = 1$.

If we only look at $x > 0$, then

$$\frac{1}{x} = \frac{d}{dx} \ln(x)$$

$$\stackrel{=}{=} \frac{d}{dx} \left[\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n} (x-1)^n \right]$$

$0 < x < 2$

$$= \frac{d}{dx} \left[(x-1) - \frac{1}{2} (x-1)^2 + \frac{1}{3} (x-1)^3 - \dots \right]$$

$$= 1 - (x-1) + (x-1)^2 - \dots$$

$$\text{So, } \frac{1}{x} = \sum_{n=1}^{\infty} (-1)^{n+1} (x-1)^{n-1} = 1 - (x-1) + (x-1)^2 - \dots$$

which has radius of convergence $r = 1$ about $x_0 = 1$.

So the series converges for $0 < x < 2$
