## Recap from last time

Given:  $y_1, y_2$  are linearly independent solutions to  $y'' + a_1(x)y' + a_0(x)y = 0$

Result: A particular solution to  $y'' + a_1(x)y' + a_0(x)y = b(x)$  is given by

$$y_p = v_1 y_1 + v_2 y_2$$

where

$$v_1 = \int \frac{-y_2 b(x)}{W(y_1, y_2)} dx, \quad v_2 = \int \frac{y_1 b(x)}{W(y_1, y_2)} dx$$

Ex: Solve

$$y'' - 4y' + 4y = (x+1)e^{2x}$$

Using variation of parameters

---

Step 1: Solve

$$y'' - 4y' + 4y = 0$$

The characteristic equation is

$$r^2 - 4r + 4 = 0$$

$$(r-2)(r-2) = 0$$

$$r = 2$$

← repeated root

$$y_h = c_1 e^{2x} + c_2 x e^{2x}$$

This gives us

$$y_1 = e^{2x}, \quad y_2 = xe^{2x}$$

to use in the next step

---

Step 2: Now we find  $y_p$  for

$$y'' - 4y' + 4y = \underbrace{(x+1)e^{2x}}_{b(x)}$$

We use

$$y_p = v_1 y_1 + v_2 y_2$$

where

$$y_1 = e^{2x}, \quad y_2 = xe^{2x}$$

Let's calculate  $v_1$  and  $v_2$ .

We need the Wronskian!

$$W(y_1, y_2) = \begin{vmatrix} y_1 & y_2 \\ y_1' & y_2' \end{vmatrix}$$

$$= \begin{vmatrix} e^{2x} & x e^{2x} \\ 2e^{2x} & e^{2x} + x(2e^{2x}) \end{vmatrix}$$

$$= (e^{2x})(e^{2x} + 2xe^{2x})$$

$$- (xe^{2x})(2e^{2x})$$

$$= e^{4x} + \cancel{2xe^{4x}} - \cancel{2xe^{4x}}$$

$$= e^{4x}$$

Then,

$$v_1 = \int \frac{-y_2 b(x)}{W(y_1, y_2)} dx$$

$$= \int \frac{-(xe^{2x}) \cdot (x+1)e^{2x}}{e^{4x}} dx$$

$$= \int \frac{-x(x+1)e^{2x}e^{2x}}{e^{4x}} dx$$

$$= \int \frac{(-x^2 - x) \cancel{e^{4x}}}{\cancel{e^{4x}}} dx$$

$$= \int (-x^2 - x) dx$$

$$= \boxed{-\frac{x^3}{3} - \frac{x^2}{2}}$$

And,

$$V_2 = \int \frac{y_1 b(x)}{W(y_1, y_2)} dx$$

$$\begin{matrix} 2x & 2x & 4x \\ e & e & = e \end{matrix}$$

$$= \int \frac{\cancel{e^{2x}} \cdot (x+1) \cancel{e^{2x}}}{\cancel{e^{4x}}} dx$$

$$= \int (x+1) dx$$

$$= \boxed{\frac{1}{2}x^2 + x}$$

Thus,

$$\begin{aligned} y_p &= V_1 y_1 + V_2 y_2 \\ &= \left(-\frac{1}{3}x^3 - \frac{1}{2}x^2\right) e^{2x} + \left(\frac{1}{2}x^2 + x\right) x e^{2x} \end{aligned}$$

Step 3: The general solution to

$$y'' - 4y' + 4y = (x+1)e^{2x}$$

is

$$y = y_h + y_p$$

$$y = c_1 e^{2x} + c_2 x e^{2x}$$

$$+ \left(-\frac{1}{3}x^3 - \frac{1}{2}x^2\right)e^{2x} + \left(\frac{1}{2}x^2 + x\right)xe^{2x}$$

Ex: Let's solve

$$y'' + y = \tan(x)$$

---

Step 1: Solve

$$y'' + y = 0$$

The characteristic equation is

$$r^2 + 1 = 0$$

roots are

$$r = \frac{-0 \pm \sqrt{0^2 - 4(1)(1)}}{2(1)}$$

$$= \frac{\pm \sqrt{-4}}{2} = \frac{\pm \cancel{\sqrt{4}} \sqrt{-1}}{\cancel{2}}$$

$$= \pm \sqrt{-1} = \pm i$$

$$= \underbrace{0 \pm 1 \cdot i}_{\alpha \pm \beta i}$$

So,

$$y_h = c_1 e^{0x} \cos(1 \cdot x) + c_2 e^{0x} \sin(1 \cdot x)$$
$$\underbrace{\hspace{10em}}_{c_1 e^{\alpha x} \cos(\beta x) + c_2 e^{\alpha x} \sin(\beta x)}$$

$$y_h = c_1 \cos(x) + c_2 \sin(x)$$

$$e^{0x} = e^0 = 1$$

For next step

$$y_1 = \cos(x), \quad y_2 = \sin(x)$$

Step 2: Find  $y_p$  for

$$y'' + y = \underbrace{\tan(x)}_{b(x)}$$

Use  $y_1 = \cos(x)$ ,  $y_2 = \sin(x)$ .

We will need

$$W(y_1, y_2) = \begin{vmatrix} y_1 & y_2 \\ y_1' & y_2' \end{vmatrix} = \begin{vmatrix} \cos(x) & \sin(x) \\ -\sin(x) & \cos(x) \end{vmatrix}$$

$$= \cos(x)\cos(x) - (\sin(x))(-\sin(x))$$

$$= \cos^2(x) + \sin^2(x)$$

$$= 1$$

We get

$$V_1 = \int \frac{-y_2 b(x)}{W(y_1, y_2)} dx$$

$$= \int \frac{-\sin(x) \tan(x)}{1} dx$$

$$= \int -\sin(x) \cdot \frac{\sin(x)}{\cos(x)} dx$$

$$= \int \frac{-\sin^2(x)}{\cos(x)} dx$$

$$= \int \frac{\cos^2(x) - 1}{\cos(x)} dx$$

$$\sin^2(x) + \cos^2(x) = 1$$

$$= \int \left( \frac{\cos^2(x)}{\cos(x)} - \frac{1}{\cos(x)} \right) dx$$

$$= \int (\cos(x) - \sec(x)) dx \quad \text{V}_1$$

$$= \sin(x) - \ln |\sec(x) + \tan(x)|$$

And,

$$V_2 = \int \frac{y_1 b(x)}{w(y_1, y_2)} dx$$

$$= \int \frac{\cos(x) \tan(x)}{1} dx$$

$$= \int \cancel{\cos(x)} \cdot \frac{\sin(x)}{\cancel{\cos(x)}} dx$$

$$= \int \sin(x) dx = \boxed{-\cos(x)}$$

$v_2$

Thus,

$$y_p = v_1 y_1 + v_2 y_2$$
$$= \left( \sin(x) - \ln|\sec(x) + \tan(x)| \right) \cos(x)$$
$$- \cos(x) \cdot \sin(x)$$

$$y_p = -\ln|\sec(x) + \tan(x)| \cdot \cos(x)$$

Step 3: The general solution to  
 $y'' + y = \tan(x)$  is

$$y = y_h + y_p$$
$$= c_1 \cos(x) + c_2 \sin(x)$$
$$- \ln|\sec(x) + \tan(x)| \cdot \cos(x)$$
